Thermal systems play an increasingly symbiotic role alongside mechanical systems in varied applications spanning materials processing, energy conversion, pollution, aerospace, and automobiles. Responding to the need for a flexible, yet systematic approach to designing thermal systems across such diverse fields, Design and Optimization of Thermal

This text presents an organized treatment of the methods and

tools used in engineering experimental work. It is designed for students laboratory courses, and practicing engineers engaged in experimental test and development work.

The volume is divided into four sections, the first of which, Genome Sequences and Beyond, illustrates the impact of genome-based information and techniques on research ranging from model organisms like yeast to less-studied basal fungal lineages. Furthermore, it highlights novel types of analysis made possible by multi-genome comparisons as well as the impact of genomics on culture collections and vice versa. The second section, Cell and Developmental Biology,

addresses questions that are important for fungal biology, e.g. the development of fungal fruiting bodies, and biology in general, e.g. chromatin organization and circadian rhythms. The third section, Genomics for Biotechnology, covers the search for plant biomass-converting enzymes in fungal genomes and work with industrially important fungi. The fourth section, focusing on Pathogenicity, offers chapters on the genomic analysis of plant and animal/human pathogens. It illustrates how genomics at all levels, from genome to metabolome, is used to study mechanisms of the interactions of fungi with other organisms.

all over the world will most probably be the major devices to open up a new era of energy supply to mankind by means of fusion plasma. Although initiated by military purposes during the Second World War (RADAR, Radio Detection and Ranging), microwave and high frequency utilisation has spread over almost every important aspect of normal day life since then, from individual mobile phones and kitchen microwave ovens to industrial food processing, production of composites as sustainable building materials, green chemistry, medical applications and finally infrastructure installations like GPS and Galileo, to name only a few examples. These different

This NATO Advanced Research Workshop was devoted to the presentation, evaluation, and critical discussion of numerical methods in nonrelativistic and relativistic hydrodynamics, radiative transfer, and radiation-coupled hydrodynamics. The unifying theme of the lectures was the successful application of these methods to challenging problems in astrophysics. The workshop was subdivided into 3 somewhat independent topics, each with their own subtheme. Under the heading radiation hydrodynamics were brought together context, theory, methodology, and application of radiative transfer and radiation hydrodynamics in astrophysics. The intimate coupling between astronomy and

Radiation physics was underscored by examples from past and present research. Frame-dependence of both the equation of transfer (plus moments) and the underlying radiation quantities was discussed and clarified. Limiting regimes in radiation-coupled flow were identified and described; the dynamic diffusion regime received special emphasis. Numerical methods for continuum and line transfer equations in a given background were presented. Two examples of methods for computing dynamically coupled radiation/matter fields were given. In I-d and assuming LTE the complete equations of radiation hydrodynamics can be solved

with current computers. Such is not the case in 2- or 3-d, which were identified as target areas for research. The use of flux-limiters was vigorously discussed in this connection, and enlivened the meeting.
