When allowing the grid to move as in the vertical Lagrangian?remap method, motion of fluid elements and thus the transport of fluid properties are measured relative to the moving grid. This transport is the dia?surface transport detailed mathematically in section D0.4. If the grid lines are fixed, as in an Eulerian method, then advective ...

A flexible and versatile method which contains the advantages of both Lagrangian and Eulerian approaches to solving compressible flows was developed. The method moves the grid so that it is required to be Lagrangian in only one coordinate direction. This flexibility permits the

The simplest approach is to move the grid based on fluid velocities in the Lagrangian fashion. Although this method might neutralize numerical diffusion associated with the nonlinear advection term, resulting computational grids typically suffer large distortions and possible tangling.

We would like to note that in a Lagrangian scheme the velocity at each side of x_i used here should be the relative fluid velocity, that is, $u_{i-} - x_{i-}$ and $u_{i+} - x_{i+}$, where $u_{i-} = M_{i-} / \tau_{i-}$, $u_{i+} = M_{i+} / \tau_{i+}$ and x_{i-} is the cell boundary's reference moving velocity which can be numerically determined as the Roe average $\frac{1}{2}(u_{i-} + u_{i+})$.

The Semi-Lagrangian scheme is a numerical method that is widely used in numerical weather prediction models for the integration of the equations governing atmospheric motion. A Lagrangian description of a system focuses on following individual air parcels along their trajectories as opposed to the Eulerian description, which considers the rate of change of system variables fixed at a particular point in space. International audienceIn this paper, we describe a cell-centered Lagrangian scheme devoted to the numerical simulation of solid dynamics on two-dimensional unstructured grids in planar geometry. This numerical method, utilizes the classical elastic-perfectly plastic material model initially proposed by Wilkins [M.L. Wilkins, Calculation of elastic-plastic flow, Meth.

This thesis presents our work related to (i) Lagrangian schemes and (ii) Arbitrary- Lagrangian-Eulerian numerical methods (ALE). Both types of methods have in commun to solve the multidimension compressible Euler equations on a moving grid. The grid moves with either the fluid velocity (Lagrangian) or an arbitrary velocity (ALE).
