NDT method. It differs from most other nondestructive testing (NDT) methods in two key respects. First, the signal has its origin in the material itself, not in an external source. Second, acoustic emission detects movement, while most other methods detect existing geometrical discontinuities.

Introduction to Acoustic Emission Testing

Acoustic Emission (AE) refers to the generation of transient elastic waves produced by a sudden redistribution of stress in a material. When a structure is subjected to an external stimulus (change in pressure, load, or temperature),

Acoustic emission testing (AET) is a non-destructive test (NDT) method that reliably recognises impending problems and defects before they become serious. Acoustic emission testing is not only ideal for localising cracks and leakage and for identifying corrosion and faults.
