After their first commercial production in late 1940s, epoxy resins comprise of wide family of materials today. Thanks to of their high strength, versatility and excellent adhesion to variety of surfaces, epoxy resins have gained wide acceptance in diverse applications (coatings, electrical, casting resins, composites...) Explore thermosetting epoxy resins in detail along with their key properties and understand what makes them an ideal choice in so many applications.

Epoxy Resin: Types, Uses, Properties & Chemical Structure

The properties of cured epoxy resins depend on the type of epoxy resin, curing agent, and curing process used. The toughness of epoxy resins can be improved by incorporating thermoplastic components, inorganics, carbon fibers, clay, and carbon nanotubes. Epoxy resins have a wide range of application including coatings, aerospace industry, electronic materials, and biomedical systems.

Synthesis and application of epoxy resins: A review ---

Epoxy resins have been extensively used for structural adhesive applications in the aerospace industry because of their high adhesive properties and low cost. Epoxy resins reinforced with high strength glass, carbon, Kevlar, or boron fibers have the greatest potential for use in the aerospace industry , . Electronic materials

Synthesis and application of epoxy resins: A review ---

Epoxy resins, also called polyepoxides, are a type of reactive prepolymers and polymers which contain epoxide groups. They have excellent chemical and heat resistance and strong adhesion properties. They are used for laminates, adhesives, flooring, linings, propellers, and surface coatings.

Epoxy resins are used in the manufacture of adhesives, plastics, paints, coatings, primers and sealers, flooring and other products and materials that are used in building and construction applications. Epoxy Glues and Structural Adhesives Most adhesives known as "structural "or "engineering" adhesives are epoxies.

Epoxy Uses in Building Construction | Building with Chemistry

The largest volume type of circuit board—an "FR-4 board"—is a sandwich of layers of glass cloth bonded into a composite by an epoxy resin. Epoxy resins are used to bond copper foil to circuit board substrates, and are a component of the solder mask on many circuit boards. Flexible epoxy resins are used for potting transformers and inductors. By using vacuum impregnation on uncured epoxy, winding-to-winding, winding-to-core, and winding-to-insulator air voids are eliminated.
