height of plants, automatic watering and feeding systems, etc.: these are only some of the developments which have transformed pot plant culture. There have also been many changes in the composts and systems used to grow the plants. Mineral soils, which formed the basis of the John Innes Composts, are now either too expensive or too difficult to obtain in suitable quality and sufficient quantity.

Consequently the grower has been forced to seek other materials such as peat, perlite, vermiculite, plastic foam, shredded bark, etc. New types of fertilisers, new methods of heat sterilisation and new chemical sterilising agents are also being used.

The use of organic residues as a means of maintaining and increasing soil fertility is of long-standing. This tradition has been somewhat neglected since the introduction of mineral fertilizers at low cost. More and more farmers and scientists are now showing renewed interest in the proper and effective use of organic residues, composts and other recycled organic additives. The role and function of organic amendments in modern agricultural systems have become topics of major interest in the scientific and agricultural communities. Research work on residue disposal has provided new concepts on the interaction between organic components and soils as well as new handling technologies (e. g. pelletizing of organic residues). The trend to conserve energy has led scientists to study the minimal tillage system, to find ways of replacing conventional inorganic fertilizers with natural organic products or microbial preparations, and to develop new composting methods. The drive to achieve higher yields in commercial greenhouse farming has led to a search for optimum substrates as growth media and for improved management techniques. This has led to the introduction of organic substitutes for peat, notably those

originating from agricultural wastes. Another important aspect is the current interest in organic farming, where use of synthetic chemicals is avoided or prohibited. An increasing percentage of the population in highly developed countries is willing to pay premium prices for food produced on soils where inorganic fertilizers and other agricultural chemicals have not been used.

Set includes revised editions of some issues.

ORNAMENTAL HORTICULTURE: SCIENCE, OPERATIONS, AND MANAGEMENT, 4E is a comprehensive introduction to the art and science of ornamental horticulture. This book provides a balanced coverage of the different elements integral to this field, including the science of ornamental horticulture, crop production, craftsmanship, and business management skills. **ORNAMENTAL HORTICULTURE** offers students a practical view of the business skills required to be successful in this growing industry, while also giving them the chance to develop their own creativity. Extensive full color illustrations, detailed list of objectives, and comprehensive review questions will help students monitor their progress.
