Aboriginal health is majorly determined by several social factors that are related to their cultural beliefs. Health professionals regularly find it difficult to provide health care to aboriginal people due to the cultural disparity that exists between the conventional and aboriginal cultures, predominantly with regard to systems of health belief (Carson, Dunbar, & Chenhall, 2007).

While their health has suffered enormously because of the arrival of the Europeans, it is assumed that Aboriginal people enjoyed good health before 1788. Using data collected from all parts of the continent, this 1995 book studies the health of Australia's original inhabitants over 50,000 years. It represents the first continental survey of its kind and is the first to quantify and describe key aspects of Australian hunter-gatherer health. The book takes a theoretical approach to Upper Pleistocene regional epidemiology and presents empirical data of the health of late Pleistocene and Holocene populations. Major categories of disease described are: stress, osteoarthritis, fractures, congenital deformations, neoplasms and non-specific and treponemal infections. The author also describes surgical techniques used by Aboriginal people. Offering fresh insight into the study of Australian prehistory and Aboriginal culture, this book will be accessible to specialists and general readers alike. It illuminates the origins of human disease, and will fill a gap in our knowledge of health in the Australasian region.

This book examines the role of media and culture in shaping contemporary conditions of violence. It argues that the collective pursuit and expression of our economic, sexual, social and political desires has catalyzed significant social transformations in human history.

'Incandescent, emotional, tragic and challenging' - Marcia Langton In this groundbreaking book, Peter Sutton asks why, after three decades of liberal

thinking, has the suffering and grief in so many Aboriginal communities become worse? The picture Sutton presents is tragic. He marshals shocking evidence against the failures of the past, and argues provocatively that three decades of liberal consensus on Aboriginal issues has collapsed. Sutton is a leading Australian anthropologist who has lived and worked closely with Aboriginal communities. He combines clear-eyed, original observation with deep emotional engagement. The Politics of Suffering cuts through the cant and offers fresh insight and hope for a new era in Indigenous politics.

When we think of "climate change," we think of man-made global warming, caused by greenhouse gas emissions. But natural climate change has occurred throughout human history, and populations have had to adapt to the climate's vicissitudes. Anthony J. McMichael, a renowned epidemiologist and a pioneer in the field of how human health relates to climate change, is the ideal person to tell this story. Climate Change and the Health of Nations shows how the natural environment has vast direct and indirect repercussions for human health and welfare. McMichael takes us on a tour of human history through the lens of major transformations in climate. From the very beginning of our species some five million years ago, human biology has evolved in response to cooling temperatures, new food sources,

and changing geography. As societies began to form, they too adapted in relation to their environments, most notably with the development of agriculture eleven thousand years ago. Agricultural civilization was a Faustian bargain, however: the prosperity and comfort that an agrarian society provides relies on the assumption that the environment will largely remain stable. Indeed, for agriculture to succeed, environmental conditions must be just right, which McMichael refers to as the "Goldilocks phenomenon." Global warming is disrupting this balance, just as other climate-related upheavals have tested human societies throughout history. As McMichael shows, the break-up of the Roman Empire, the bubonic Plague of Justinian, and the mysterious collapse of Mayan civilization all have roots in climate change. Why devote so much analysis to the past, when the daunting future of climate change is already here? Because the story of mankind's previous survival in the face of an unpredictable and unstable climate, and of the terrible toll that climate change can take, could not be more important as we face the realities of a warming planet. This sweeping magnum opus is not only a rigorous, innovative, and fascinating exploration of how the climate affects the human condition, but also an urgent call to recognize our species' utter reliance on the earth as it is.

Between the Murray and the Sea: Aboriginal Archaeology in South-eastern Australia explores the Indigenous archaeology of Victoria, focusing on areas south and east of the Murray River. Looking at multiple sites from the region, David Frankel considers what the archaeological evidence reveals about Indigenous

society, migration, and hunting techniques. He looks at how an understanding of the changing environment, combined with information drawn from 19th-century ethnohistory, can inform our interpretation of the archaeological record. In the process, he investigates the nature of archaeological evidence and explanation, and proposes approaches for future research. 'A carefully crafted and impressively illustrated depiction of the economic and social lives of past Aboriginal peoples who lived in the diverse landscapes that existed between the Murray and the sea. This book will be valuable to both specialists and non-specialists alike, as it provides a foundation for thinking about the remarkable variety of ways Aboriginal foragers adapted to the lands of southeastern Australia.' Peter Hiscock, Tom Austen Brown Professor of Australian Archaeology, University of Sydney

In a break from the contemporary focus on the law's response to inter-racial crime, the authors examine the law's approach to the victimization of one Indigenous person by another. Drawing on a wealth of archival material relating to homicides in Australia, they conclude that settlers and Indigenous peoples still live in the shadow of empire.

This book presents original and provocative views on the complex and dynamic social lives of Indigenous Australians from an historical perspective. Building on the foundational work of Harry Lourandos, the book critically examines and challenges traditional approaches which have presented Indigenous Australian pasts as static

and tethered to ecological rationalism. The book reveals the ancient past of Aboriginal Australians to be one of long-term changes in social relationships and traditions, as well as the active management and manipulation of the environment. It encourages a deeper appreciation of the ways Aboriginal peoples have engaged with, and constructed their worlds. It solicits a deeper understanding of the contemporary political and social context of research and the insidious impacts of colonialist philosophies. In short, it concerns people: both past and present. Ultimately, *The Social Archaeology of Australian Indigenous Societies* looks beyond the stereotype of Aboriginal peoples as hunter-gatherers and charts new and challenging agendas for Australian Aboriginal archaeology.

A Companion to Paleopathology offers a comprehensive overview of this rapidly growing sub- field of physical anthropology. Presents a broad overview of the field of paleopathology, integrating theoretical and methodological approaches to understand biological and disease processes throughout human history. Demonstrates how paleopathology sheds light on the past through the analysis of human and non-human skeletal materials, mummified remains and preserved tissue. Integrates scientific advances in multiple fields that contribute to the understanding of ancient and historic diseases, such as epidemiology, histology, radiology, parasitology, dentistry, and molecular biology, as well as archaeological, archival and historical research. Highlights cultural processes that have an impact on the evolution of illness, death and dying in human populations, including

When researchers want to study indigenous populations they are dependent upon the highly variable way in which states or territories enumerate, categorise and differentiate indigenous people. In this volume, anthropologists, historians, demographers and sociologists have come together for the first time to examine the historical and contemporary construct of indigenous people in a number of fascinating geographical contexts around the world, including Canada, the United States, Colombia, Russia, Scandinavia, the Balkans and Australia. Using historical and demographical evidence, the contributors explore the creation and validity of categories for enumerating indigenous populations, the use and misuse of ethnic markers, micro-demographic investigations, and demographic databases, and thereby show how the situation varies substantially between countries.
