The world's human population is growing at an exponential rate. Humans have increased the world's carrying capacity through migration, agriculture, medical advances, and communication. The age structure of a population allows us to predict population growth. Unchecked human population growth could have dire long-term effects on our environment.

Human Population Growth | Biology II

Key Theme 1: Patterns of Population. This theme comes first because the number of men and women in the world, the distribution of populations around the globe, and the migration patterns of people from one region to another have always had a large effect on all other types of change. The study of population size, density, and distribution is called demography.

But unsustainable human population growth can overwhelm those efforts, leading us to conclude that we not only need smaller footprints, but fewer feet. Portland, Oregon, for example, decreased its combined per-capita residential energy and car driving carbon footprint by 5 percent between 2000 and 2005.

Human Population Growth and Climate Change

In stage 1, the population grows slowly or not at all. In stage 2, birth rates remain high but death rates decline so the population increases. In stage 3, the birth rate and death rate are about equal, so the population stabilizes. In stage 4, the birth rate declines while the death rate stays low, so the population decreases.
