These related values display the same trend in the periodic table. As you move down the periodic table, elements have more protons and gain an electron energy shell, so atoms become larger. As you move across a row of the periodic table, there are more protons and electrons, but the electrons are held more closely to the nucleus, so the overall size of the atom decreases.

~~Easy To Use Chart of Periodic Table Trends~~

Periodic trends, arising from the arrangement of the periodic table, provide chemists with an invaluable tool to quickly predict an element's properties. These trends exist because of the similar atomic structure of the elements within their respective group families or periods, and because of the periodic nature of the elements.

Periodic Table Trends: The following trend in periodic properties of elements is observed:
Atomic size Trends: The distance between the centre of the nucleus and the outermost shell of an atom is known as the atomic radius. In a group the atomic size increases due to the addition of shells as we move from one period to another.

For the second section of the worksheet students first fill in various elements on a blank periodic table and then compare the various elements to each other using the trends. After doing the partner practice on the first section students find the second part easier, and I encourage them to try the questions on their own first and then ask their table partners or myself for help if they are stuck.

Does ionization energy increase going up or down a column in the periodic table? Do atoms get smaller or larger from right to left across a row? Most students have a hard time answering these questions. In this cooperative activity, students use microscale reaction plates and straws of different lengths to construct three-dimensional bar-type charts of element properties.
