Stochastic Analysis and Diffusion Processes presents a simple, mathematical introduction to Stochastic Calculus and its applications. The book builds the basic theory and offers a careful account of important research directions in Stochastic Analysis. The breadth and power of Stochastic Analysis, and probabilistic behavior of diffusion processes are told without compromising on the mathematical details.

A stochastic process is a collection of random variables  $X = \{X_t; t \in T\}$  where, for each fixed  $t \in T$ ,  $X_t$  is a random variable from  $(\Omega, \mathcal{F}, P)$  to  $(E, \mathcal{G})$ .  $\Omega$  is known as the sample space, where  $E$  is the state space of the stochastic process  $X_t$ . The set  $T$  can be either discrete, for example the set of positive integers  $\mathbb{Z}^+$ , or continuous,  $T = \mathbb{R}^+$ .

## *STOCHASTIC PROCESSES AND APPLICATIONS*

Four stochastic processes are included in Risk Simulator's Forecasting tool, including geometric Brownian motion or random walk, which is the most common and prevalently used process due to its simplicity and wide-ranging applications. The other three stochastic processes are the mean-reversion process, jump-diffusion process, and a mixed process.

The theory of stochastic processes, at least in terms of its application to physics, started with Einstein's work on the theory of Brownian motion: Concerning the motion, as required by the molecular-kinetic theory of heat, of particles suspended in liquids at rest (1905) and in a series of additional papers that were published in the period 1905–1906.

In fact, fractional diffusion equations and the nonlinear fractional diffusion equations have been successfully applied to several physical situations such as percolation of gases through porous media , thin saturated regions in porous media , standard solid-on-solid model for surface growth , thin liquid films spreading under gravity , in the transport of fluid in porous media and in viscous fingering , modeling of non-Markovian dynamical processes in protein folding , relaxation to ...

Sample continuity. An Itô diffusion  $X$  is a sample continuous process, i.e., for almost all realisations  $B_t$  (?) of the noise,  $X_t$  (?) is a continuous function of the time parameter,  $t$ . More accurately, there is a "continuous version" of  $X$ , a continuous process  $Y$  so that  $[X]_t = [Y]_t$ . This follows from the standard existence and uniqueness theory for strong solutions of stochastic differential equations.
